# ***AWP Bioorganik (Bereich Linker) Gliederung***

## **1. Kohlenhydrate**

1.1 Einführung: Konzepte, Literatur, historische Einordnung

1.2 Struktur von Kohlenhydraten

1.2.1 Monosaccharide, Oligosaccharide, Polysaccharide

1.2.2 Analytik von Kohlenhydraten

1.3 Schutzgruppen für Kohlenhydrate

1.3.1 Schutzgruppen am anomeren Zentrum

1.3.2 Acyl-, Ether-, Acetal-Schutzgruppen

1.3.3 Spezielle Schutzgruppen

1.4 Modifizierte Kohlenhydrate

1.4.1 Funktionalisierung an Alkoholgruppen

1.4.2 Funktionalisierung am anomeren Zentrum

1.4.3 C-Glycoside

1.4.4 Glycale

1.5 O-Glycosid-Synthesen

1.5.1 Chemische Synthese

1.5.2 Enzymatische Synthese

1.5.3 Synthese an fester Phase

1.6 Kohlenhydrate als chirale Ausgangsstoffe

1.6.1 Industrieller Einsatz von Kohlenhydraten

1.6.2 Kohlenhydrate in Naturstoffsynthesen

1.7 Radikalreaktionen mit Kohlenhydraten

1.7.1 Generelle Aspekte der Radikalchemie

1.7.2 Reduktionen und Umlagerungen an Kohlenhydraten

1.7.3 Additionen von Kohlenhydratradikalen an Mehrfachbindungen

1.7.4 Radikalische Additionen an Glycale

*Structures and trivial names of the most common disaccharides.*

*Structures of  $\alpha$ -,  $\beta$ -, and  $\gamma$ -cyclodextrin.*

An example of TLC, used to check the result of purification by column chromatography on silica gel. Visualization of the spots was achieved by 10% ethanolic  $H_2SO_4$  and heating. Three carbohydrate derivatives were separated. The compound with the highest  $R_f$  value elutes first, the one with the smallest  $R_f$  value is the last to be collected. To improve the performance of column chromatography, solvent gradients may be used, in which the polarity of the eluant is slowly increased.

An example of TLC in which the reducing sugar, 2,3,4,6-tetra-O-acetyl-glucose, the corresponding pentaacetate and 2,3,4,6-tetra-O-acetyl- $\alpha$ -D-glucopyranosyl bromide have been distinguished. The TLC plate is labelled on the copy given on the right, indicating  $R_f$  values and structures for every spot. In the case of the 1-OH-free glucose derivative a small amount of the second anomer can be seen as shadow below the main spot. This TLC has been performed on silica gel, with ethyl acetate-toluene (1:1) as the mobile phase. Detection of the compounds was achieved by dipping the plate into 10% ethanolic  $H_2SO_4$  followed by heating.

$^1\text{H}$  NMR spectrum of 2,3,4,6-tetra-O-acetyl- $\alpha$ -D-glucopyranosyl bromide, recorded in  $\text{CDCl}_3$  at 400 MHz. The doublet for H-1 and the singlets for the acetyl groups are expanded.

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) spectra of  $\alpha$ - and  $\beta$ -penta-O-acetyl-glucose. The doublet for H-1 is expanded in each case and its chemical shift and coupling constant  $^3J_{1,2}$  are indicated.

$^1\text{H}$ - $^{13}\text{C}$ -COSY of (2-bromoethyl) 2,3,4,6-tetra-O-acetyl-β-D-glucoside. All multiplets recorded in the  $^1\text{H}$  spectrum of the compound can be cross-peak-correlated to the carbon atoms to which these hydrogens are attached. This is indicated for the H-1-C-1 correlation. This method facilitates the exact assignment of all  $^{13}\text{C}$  peaks.

*Conformation of glucose in vacuo:*

6-OH

*Conformation of glucose in water:*

6-OH

*The structure of D-glucopyranose as obtained in vacuo in comparison with the structure of the same molecule dissolved in water as calculated by molecular dynamic simulations. The 6-OH group, e.g., points towards the endocyclic ring oxygen in vacuo, expressing an intramolecular hydrogen bridge, whereas this 6-hydroxyl group is saturated with surrounding water molecules, once the monosaccharide is modeled in aqueous solution.*

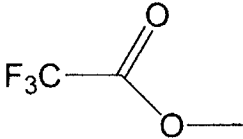

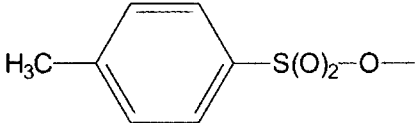

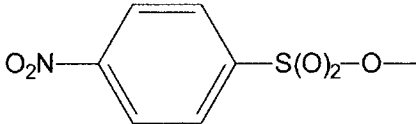

Several free monosaccharides can be converted by isopropylideneation ( (i):  $H^+$ , acetone) to useful building blocks which possess a single unprotected OH group, in a one step-reaction. The less stable isopropylidene group in each of the obtained diisopropylidene derivatives can be selectively cleaved to produce the respective sugars with 3 free hydroxyl groups ( (ii): diluted HOAc). Complete cleavage of all isopropylidene rings is often affected with conc. TFA.

*Mechanism of oxidative cleavage of p-methoxybenzyl (pMBn) ethers using the electron deficient quinone DDQ (2,3-dichloro-5,6-dicyano-1,4-benzoquinone).*

**Table 4–1.** Leaving groups regularly used in substitution reactions with carbohydrate derivatives.

	Leaving group	Name
<b>Lower reactivity</b>	Cl—	Chloro-
		Trifluoroacetyl-
	Br—	Bromo-
	I—	Iodo-
	H <sub>3</sub> C—S(O) <sub>2</sub> —O—	Mesyl-
<b>Higher reactivity</b>		Tosyl-
		<i>p</i> -Nitrophenylsulfonyl-
<b>Significantly more reactive than all others</b>	F <sub>3</sub> C—S(O) <sub>2</sub> —O—	Triflyl-

**Table 5–1.** The most common leaving groups in glycosyl donors and a selection of typically employed activators.

Leaving group	Activator	Comments
LG = OAc	BF <sub>3</sub> ·Et <sub>2</sub> O, SnCl <sub>4</sub> , TMSOTf	Not for complex oligosaccharides
LG = Br	AgCO <sub>4</sub> , AgOTf, Hg(CN) <sub>2</sub>	Most commonly used donor
LG = Cl	AgOTf, Hg(CN) <sub>2</sub> , HgBr <sub>2</sub>	More stable than glycosyl bromide
LG = F	SnCl <sub>2</sub> –AgOTf	Can be combined with thioglycosides
LG = OC(NH)CCl <sub>3</sub>	BF <sub>3</sub> ·Et <sub>2</sub> O, TMSOTf	Mild reaction conditions, widely used
LG = SR	TfOH–NIS, DMTST, IDCP	Can also serve as an acceptor in the absence of thiophilic reagents
LG = O(CH <sub>2</sub> ) <sub>3</sub> CH=CH <sub>2</sub>	NIS–TESOTf, I(col) <sub>2</sub> ClO <sub>4</sub>	Can also serve as an acceptor in the absence of bromine

Table 1.1 Approximate prices of carbohydrate derivatives (1995)

Compound	Price (\$/100 g)	Source
Sucrose (1.23)	0.5	Sugar cane
D-Glucose (1.01)	0.5	Starch
D-Fructose (1.09)	1.0	Glucose
D-Gluconic acid (1.12)	1.0	Glucose
D-Glucitol (sorbitol) (1.19)	1.0	Glucose
Lactose (1.24)	1.5	Milk (whey)
D-Mannitol (1.20)	2.0	Fructose
Methyl $\alpha$ -glucopyranoside (1.11)	4.0	Glucose
Maltose (1.25)	4.0	Starch
D-Isoascorbic acid (1.16)	4.0	Glucose
D-Glucono-1,5-lactone (1.12)	5.0	Glucose
D-Galactose (1.02)	6.0	Lactose
L-Sorbose (1.10)	7.0	Glucose
D-Glycero-D-gulo-heptonic acid (1.13)	7.0	Glucose
D-Glucosamine (1.18)	10	Sea shells
D-Xylose (1.07)	10	Wood
Dianhydroglucitol (1.21)	12	Glucose
D-Glucurono-3,6-lactone (1.14)	13	Glucose
L-Ascorbic acid (1.15)	14	Glucose
L-Arabinose (1.05)	33	Plant gum
D-Arabinose (1.04)	33	Glucose
Diisopropylideneketogulonic acid (1.22)	40	Glucose
D-Ribose (1.06)	44	Yeast
D-Mannose (1.03)	46	Ivory nut
D-Glucaric acid (1.17)	57	Glucose
L-Rhamnose (1.08)	125	Oak bark

**Scheme 1.2** Industrial production of D-mannitol

*Synthesis of a KHL-conjugated tetrasaccharide which is specific for anthrax and can be used for its detection.*<sup>57</sup>
