

Who can believe that this happened in Iran in consecutive two years? The year 2018-19 is the second wettest year and the year 2017-18 is second driest Hydrological year in the record in Karun Basin (Iran). Also, April 2019 is wettest Hydrological month in record with a very big flood (more than 1000 return period) in Karkheh and Dez River.

Seasonal Forecasting of Hydrometeorology is therefore pivotal for regulating reservoirs and sustaining agricultural output in Iran.

We want to talk about two last Hydrological year of Iran in Golm (Haus 1, Raum 1.15) next Wednesday on 23 Oct. at 3pm.

All interested people are welcome to join!
